Quick Heal launches metaProtect for family devices

Pune: Cybersecurity firm Quick Heal Technologies has launched metaProtect, a cloud-based platform for advanced remote security and privacy management, which allows users to safeguard the entire family's devices. The company has also developed YouTube content control that filters through parameters, such as channels, viewing history and keywords. This ensures that children will not encounter objectionable content.

The metaProtect and YouTube content control is supported by Version 24 (v24) platform, which simplifies the complex landscape of cybersecurity. V24 is built on artificial intelligence which can hunt malware's without human intervention. V24 has a simplified user interface accessible to users of all ages and technical backgrounds. It introduces two features — security score and privacy score — providing tips and assessments of privacy and security status of the device.
